LoCoML: Towards development of a low code ML platform

Project Team:
Ayush Agrawal
Rohan Chowdary
Siddharth Mavani

Project Guide:
Dr. Karthik
Vaidhyathan

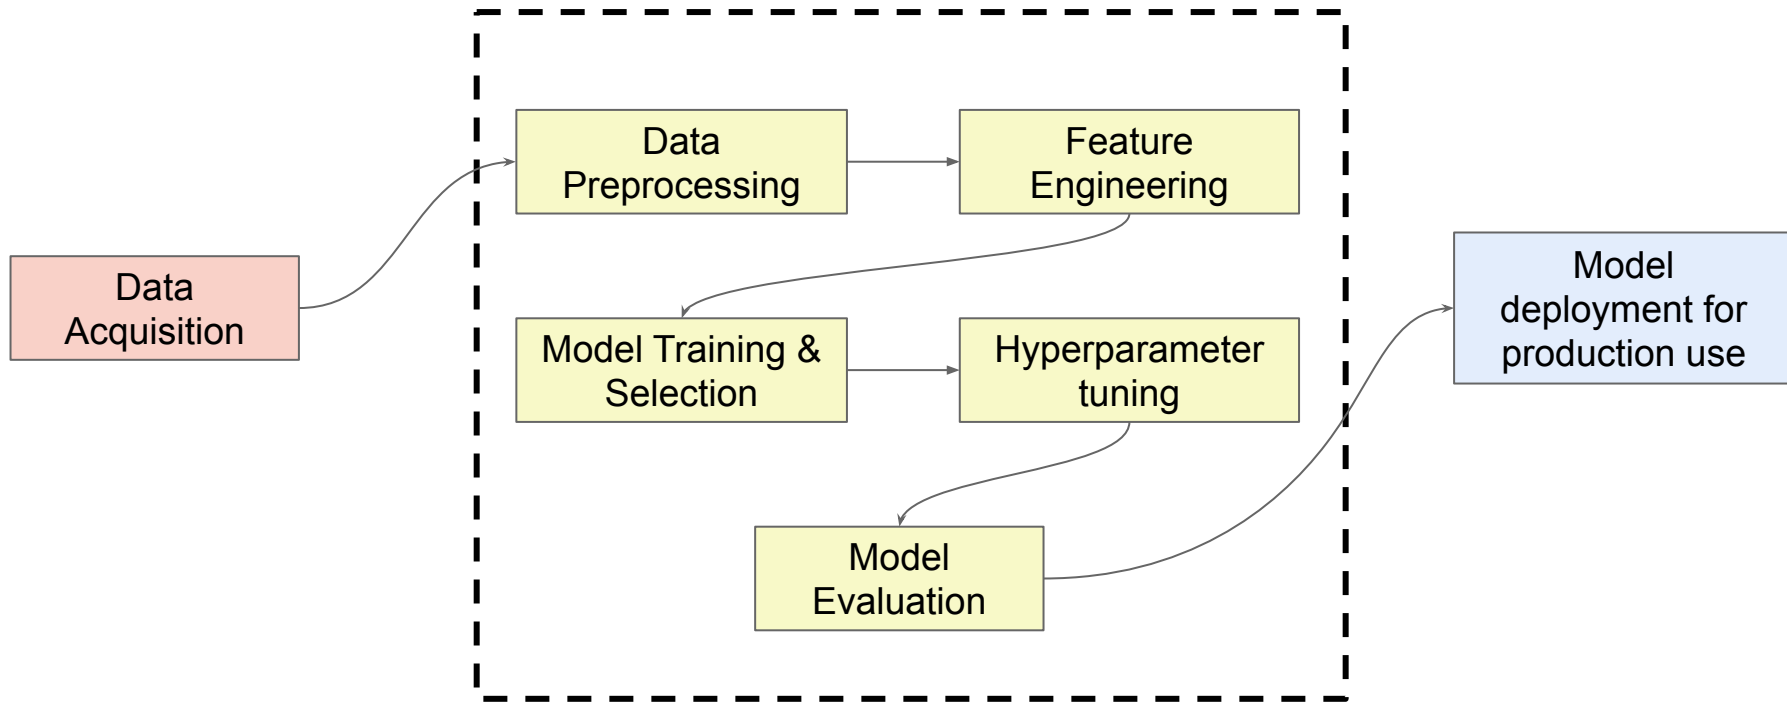

What is low code ML?

- Provides an easy and efficient way to build ML models
- Enables users with limited ML experience to train high quality models specific to their needs.
- It incorporates automation features for various stages of the ML pipeline, such as data preprocessing, feature engineering, model training and so on.

Traditional ML vs AutoML

Traditional Approach

AutoML automates the various steps

Tasks Completed before Mid Evals

01

Data Ingestion

Users can upload csv files from local machine

02

EDA

Users can see a quick exploratory analysis of the columns of selected data

03

Data Preprocessing

Providing options to preprocess data

04

Training the models

Users can select autoML mode with appropriate manual control wherever required

05

Model Evaluation

Model is evaluated on a number of metrics

Demo

Advantages of Low Code ML

01 Faster Development

Quickly develop ML models from concept

02

Accessibility

Accessible to a broad range of users

03

Cost-Effective

Reduces the need of specialized ML Devs

04

Rapid Prototyping

Facilitates rapid prototyping and experimentation

05

Maintenance

Enables to track model performance

06

Quick Proof of Concept

Ideal for developing quick proof of concepts

Low Code ML

Tasks completed after Mid Evals

Dashboard

Added overall statistics of the platform

01

Model Deployment

Successfully able to deploy model on a docker container

03

Model Versioning

Implemented various methods to update model & version them

05

Model Cards

Designed a compact representation of model info

02

Visualizations

Added graphs and visualizations for models

04

Inference

Implemented single case & batch inference to get predictions instantly

06

Thank You
